TODO : Qualitatively describe your observations and suggest a concept to eliminate the artifacts in the filtered images.

Ans: I found that the method that I use (remove only the center of FT) is not good enough. It would be great if can apply other removal function (e.g. sine) or remove other part of FT because the source code pattern has other parameter (e.g. theta). The result should be better but loose sharpness.

TODO : Describe what the custom shape of the PSF did to the original image and what are the differences in the recovered and the original photos

Ans: The custom shape of psf is rhombus and when we apply to the original image, the picture is brightened. The difference between recovered and original images is sharpness. Recovered image leads to the loss in sharpness.

2.2 Image recovery from hardware-originated Bokeh effect
